Re: Senior Product Manager, Billing Engine & Platforms Monetization — GitLab

Dear GitLab Monetization team,

Your description of this role names the problem I have spent the last three years solving in payments: making a new capability work with money on launch day, without turning each one into a bespoke project. I build backend money-movement platforms whose main users are other teams, and I'd like to bring that experience to GitLab's usage billing pipeline.

Making onboarding repeatable. At SkyRo I standardized integration contracts, transaction identifiers, status transitions and error mapping across 4+ PSP, EMI and acquiring partners. Adding a partner went from a custom project to a 2.5-week process. At inDrive I built the payment orchestration platform from discovery to rollout across 40 countries, with one internal transaction state model that every provider maps into. This is the same pattern you describe for credit-consuming capabilities: a clear contract, so a new team can become billable without reinventing the plumbing.

Getting the amount right. At SkyRo I owned the payments platform behind credit products: balances that change with every drawdown and repayment, payoff amounts that are invalidated and recalculated before money moves, and idempotency, retries and reconciliation so nothing is charged twice or missed. Drawing down against a balance and handling edge cases at execution time is close to the credit-drawdown problems in usage billing. I care about catching errors before they reach a customer.

Balancing reliability, cost and new capability. At inDrive I designed cost-aware routing that saved ~$100K/month (~20%), and provider health management that reached a 96.4% SLA. Earlier I launched pricing models: a CPA model adopted by 90% of wholesale sellers at Drom.ru, and a paid analytics subscription at Sbermarket.

To be direct about the gap: I haven't owned a metering and rating pipeline or worked hands-on with Zuora. I learn systems by reading the specs, data and failure modes, not slides, and I expect to spend my first weeks deep in CustomersDot and the Zuora integration. The hard parts I already know well are state, accuracy, reconciliation, and aligning Engineering, Finance and Compliance. I led PCI DSS Service Provider certification across those functions at inDrive.

I work remotely, lead through written specs and use AI tools daily for analysis and spec writing, so GitLab's async, handbook-first way of working feels natural to me. I'm based in Kazakhstan and open to relocation, and I'm happy to discuss location eligibility early in the process.

Thank you for your time. I'd welcome the chance to talk.

Best regards,
Ekaterina Deys
